CLASS NUMBER: # 07

SECTION: BSA - AC 192

NAME: Drame Jedfrey

DATE: Nou 8 2019

PART 1: Identify the following.

Daratype

1. A classification that describes what values can be assigned, how the variable is stored, and what types of operations can be performed with the variable.

Hiercarchy Chart 2. A diagram that illustrates modules' relationships to each other.

Para DicHonary 3. A list of every variable name used in a program, along with its type, size, and description.

Functional Cohesion 4. A measure of the degree to which all the module statements contribute to the same task. Prompt energy 5. A message that is displayed on a monitor to ask the user for a response and perhaps explain how that response should be formatted.

A module that can more easily be reused in multiple programs.

portante Floating Point

7. A number with decimal places. & A program component's name.

1 dentifier Numeric Constant

9. A specific numeric value.

Declaration

10. A statement that provides a data type and an identifier for a variable.

Hungarian Notations 12. A variable-naming convention in which a variable's data type or other information is stored as part of its name.

Imeger

12. A whole number.

Binary Operator

13. An operator that requires two operands—one on each side.

Magic Number

14. An unnamed constant whose purpose is not immediately apparent.

Assignment statement 15 Assigns a value from the right of an assignment operator to the variable or constant on the left of the assignment operator.

Alphanomenic Values 16. Can contain alphabetic characters, numbers, and punctuation.

heywords

17. Constitute the limited word set that is reserved in a language.

Module Body

18. Contains all the statements in the module.

Annutation Symbol 19. Contains information that expands on what appears in another flowchart symbol; it is most often represented by a three-sided box that is connected to the step it references by a dashed

line

self Documenting

20 Contains meaningful data and module names that describe the program's purpose.

```
and right aspecialisty
                 Associativity (24. Describe operators that evaluate the expression to the right first.
                                      22. Describes data that consists of numbers.
                Rugard Association 2.2. Describes operators that evaluate the expression to the left first.
                                     24. Describes the extra resources a task requires.
            Overnead
         Ordex of Operations 25. Describes the rules of precedence.
                                    26. Describes the state of data that is visible.
          In scope
                                    27. Describes the unknown value stored in an unassigned variable.
   · Garbage
                                    28. Describes variables that are declared within the module that uses them.
        Local
                                    29. Describes variables that are known to an entire program.
      Calorocal
 t tolas of Precedence 30. Dictate the order in which operations in the same statement are carried out.
 ( Ex ternal Documentation 31. Documentation that is outside a coded program.
F Internal Documentation 32. Documentation within a coded program.
   peal Numbers 33. Floating-point numbers.
   Ena of Job tacus, 34. Hold the steps you take at the end of the program to finish the application.
  House heping Tasks 35. Include steps you must perform at the beginning of a program to get ready for the rest of the
                                           program.
  petail loop task. 38. Include the steps that are repeated for each set of input data.
  Mobile header 37. Includes the module identifier and possibly other necessary identifying information.
 lower carnel easing 38. Is another name for the camel casing naming convention.
                                   39. Is sometimes used as the name for the style that uses dashes to separate parts of a name.
                                    40. Marks the end of the module and identifies the point at which control returns to the program or
     Ke bob case
 Module Deturn
                                       module that called the module.
          statement
 Nameric ucricible 41. One that can hold digits, have mathematical operations performed on it, and usually can hold a
                                           decimal point and a sign indicating positive or negative.
                                    42 Runs from start to stop and calls other modules.
                                    43 Similar to a variable, except that its value cannot change after the first assignment.
   Main Program
                                    44. Small program units that you can use together to make a program; programmers also refer to
   Named Constant
                                           modules as subroutines, procedures, functions, or methods.
   Modules
                                    45. The act of assigning its first value, often at the same time the variable is created.
  Intelizing
            the vicinoble
Functional pecome of the act of reposting input back to the act of the act of
                                    46. The act of containing a task's instructions in a module.
                                    48. The act of repeating input back to a user either in a subsequent prompt or in output.
ecropy of the equal sign; it is used to assign a value to the variable or constant on its left.
                                    50. The feature of modular programs that allows individual modules to be used in a variety of
 re usability
```

applications.

chility el casing 51. The feature of modular programs that assures you a module has been tested and proven to function correctly.

52. The format for naming variables in which the initial letter is lowercase, multiple-word variable names are run together, and each new word within the variable name begins with an uppercase

53 The format for naming variables in which the initial letter is uppercase, multiple-word variable names are run together, and each new word within the variable name begins with an uppercase

mainline loopic LHOUSE

pascal Casina

54. The logic that appears in a program's main module; it calls other modules.

55. The memory address identifier to the left of an assignment operator.

Abstraction call a module Program Level

comments

Drogram

modulation 56. The process of breaking down a program into modules.

52 The process of paying attention to important properties while ignoring nonessential details.

58. To use the module's name to invoke it, causing it to execute.

59. Where global variables are declared.

60. Written explanations that are not part of the program logic but that serve as documentation for those reading the program.

## Choose from the following

1. Abstraction -

2. Alphanumeric values

3. Annotation symbol

4. Assignment operator

5. Assignment statement '

6. Binary operator

7. Call a module / 8. Camel casing \*

9. Data dictionary

10. Data type '

11. Declaration

12. Detail loop tasks -

13. Echoing input,

14. Encapsulation /

15. End-of-job tasks /

16. External documentation /

17. Floating-point /

18. Functional cohesion '

19. Functional decomposition

20. Garbage

21. Global

22. Hierarchy chart

23. Housekeeping tasks /

24. Hungarian notation /

25. Identifier -

26. In scope

27. Initializing the variable -

28. Integer -

29. Internal documentation /

30. Kebob case

31. Keywords

32. Left-to-right associativity

33. Local

34. Lower camel casing

35. Lvalue

36. Magic number

37. Main program

38. Mainline logic

39. Modularization

40. Module body

41. Module header

42. Module return statement

43. Modules

44. Named constant

45. Numeric

46. Numeric constant (literal numeric constant)

47. Numeric variable

48. Order of operations

49. Overhead

50. Pascal casing

51. Portable

52. Program comments

53. Program level

54. Prompt

55. Real numbers

56. Reliability

57. Reusability

58. Right-associativity and right-to-left associativity

59. Rules of precedence
